

Species *Methanoliparum thermophilum*^{Ts}

Etymology

[ther.mo.phi'lum] Gr. n. *thermē*, heat; N.L. neut. adj. suff. *-philum*, friend, loving (from Gr. adj. *philos* -ē -on); N.L. neut. adj. *thermophilum*, heat-loving

Nomenclatural type

[NCBI Assembly: GCA_004212075.1](#) ^{Ts}

Description

This organism is not isolated. It is represented by a near-complete MAG, NM1a, (GCA_004212075.1) obtained from an enrichment culture (50°C) using biodegraded oil as inoculum from Brazil. Analyses of enrichment cultures (Borrel et al., 2019; Laso-Perez et al., 2019; Zhou et al., 2022) indicate that this organism can utilize long-chain alkanes as substrate for methanogenesis.

Classification

Archaea » Methanobacteriota » Methanoliparia » Methanoliparales » Methanoliparaceae » *Methanoliparum* » *Methanoliparum thermophilum*^{Ts}
