

## Species *Electrothrix gigas*

---

### Etymology

[gi'gas] N.L. masc. n. *gigas*, a giant (nominative in apposition), referring to its very large cell diameter

### Nomenclatural type

[NCBI Assembly: GCA\\_022766165.1](#)<sup>TS</sup>

### Reference Strain

AU1\_5 (TS)

### Description

Filamentous bacteria of centimeter length that inhabit the surface of marine and coastal sediment and conduct electrons from sulfide-oxidizing cells to oxygen-reducing cells. Cell diameters >2.5 µm (commonly 2.5-8 µm). Gliding motility. Gram-negative, with distinct ridges running longitudinally along the filament. Can assimilate acetate and propionate; CO<sub>2</sub> fixation via the Wood-Ljungdahl pathway. Contains c-type cytochromes and type IV pili (PilA). Polyphosphate and polyglucose storage. Distinguishable by size, 16S rRNA gene sequence and genome.

### Classification

*Bacteria* » *Desulfobacterota* » *Desulfobulbia* » *Desulfobales* » *Desulfobulbaceae* » *Electrothrix* » *Electrothrix gigas*
