

Genus *Azoamicus*

Etymology

[A.zo.a'mi.cus] N.L. pref. *azo-*, pertaining to nitrogen; L. masc. n. *amicus*, friend; N.L. masc. n. *Azoamicus*, friend that pertains to nitrogen

Nomenclatural type

Species *Azoamicus ciliaticola*^{Ts}

Description

‘*Candidatus Azoamicus ciliaticola*’ is an obligate endosymbiont of an anaerobic ciliate and has a dedicated role in respiration and providing energy for its eukaryotic host. ‘*Candidatus A. ciliaticola*’ contains a highly reduced 0.29-Mb genome that encodes core genes for central information processing, the electron transport chain, a truncated tricarboxylic acid cycle, ATP generation and iron–sulfur cluster biosynthesis. The genome encodes a respiratory denitrification pathway instead of aerobic terminal oxidases, which enables its host to breathe nitrate instead of oxygen. ‘*Candidatus A. ciliaticola*’ and its ciliate host represent an example of a symbiosis that is based on the transfer of energy in the form of ATP, rather than nutrition.

Classification

Bacteria » *Pseudomonadota* » *Gammaproteobacteria* » “*Azoamicales*” » “*Azoamicaceae*” » *Azoamicus*
