

Arsenophonus lipoptenae sp. nov.

Submitted by Rasmussen, Ejnar

Species *Arsenophonus lipoptenae*

Etymology

[li.po.pte'nae] **N.L. gen. n.** *lipoptenae*, of the louse fly genus *Lipoptena*

Nomenclatural type

[Genome sci|0006250](https://genome.sci.0006250) ^{Is}

Description

Nováková et al., 2016: *Arsenophonus lipopteni* (*Enterobacteriaceae*, *Gammaproteobacteria*) is an obligate intracellular symbiont of the blood feeding deer ked, *Lipoptena cervi* (Diptera: Hippoboscidae). The bacteria reside in specialized cells derived from host gut epithelia (bacteriocytes) forming a compact symbiotic organ (bacteriome). Compared to the closely related complex symbiotic system in the sheep ked, involving four bacterial species, *Lipoptena cervi* appears to maintain its symbiosis exclusively with *Ca. Arsenophonus lipopteni*.

Classification

Bacteria » *Pseudomonadota* » *Gammaproteobacteria* » *Enterobacterales* » *Morganellaceae* » *Arsenophonus* » *Arsenophonus lipoptenae*
