

## Genus *Fervidibacter*

### Etymology

[Fer.vi.di.bac'ter] L. masc. adj. *fervidus*, hot, steaming; N.L. masc. n. *bacter*, a rod; N.L. masc. n. *Fervidibacter*, a hot rod

### Nomenclatural type

Species *Fervidibacter sacchari*<sup>Ts</sup>

### Description

Genomes belonging to the genus have been recovered from metagenomic sequence data from thermal environments in Antarctica, Canada, China, Japan, and USA. GC content within the genus range between 49% to 59%. Phylogenomic congruence and relative evolutionary divergence along with ANI and AAI values support designation of this group as a genus. ANI values among species in the genus are below species delineation guidelines. Available genome data support members of the genus largely being aerobic or microaerophilic, with subunits of both the high-affinity and low-affinity terminal oxidases encoded within the genus. Numerous glycoside hydrolases are encoded by species in the genus, supporting a likely saccharolytic lifestyle for members of the genus.

### Classification

Bacteria » Armatimonadota » Fervidibacteria » Fervidibacteriales » Fervidibacteraceae » Fervidibacter
