

## Genus *Bostrichicola*

---

### Etymology

[Bos.tri.chi.di'co.la] L. n. *Bostrichidae*, the Bostrichidae family of wood-boring beetles; L. suff. *-cola*, an inhabitant or dweller; L. masc. n. *Bostrichicola*, the Bostrichicola genus

### Nomenclatural type

Species *Bostrichicola ureolyticus*<sup>T5</sup>

### Description

"Bostrichicola" is a genus name proposed for a taxonomically significant organism associated with Bostrichid beetles, particularly those found in the subfamilies Dinoderinae and Lyctinae. The term "Bostrichicola" suggests an ecological connection with beetles belonging to the Bostrichidae family. The genus may harbor organisms with unique characteristics or symbiotic relationships, reflecting its role within the broader context of beetle biology.

While the specific attributes of "Bostrichicola" are not detailed in the provided information, the genus name serves as a taxonomic label, offering a means to categorize and identify this group of organisms in relation to Bostrichid beetles. Further taxonomic investigations and research may unveil additional insights into the biology, ecology, and functional roles of "Bostrichicola" within the Bostrichidae family.

### Classification

*Bacteria* » *Bacteroidota* » *Flavobacteriia* » *Flavobacteriales* » *Flavobacteriaceae* » *Bostrichicola*
